AB Title compds. I (X1 = halo; R1, R2 = acyl), useful as intermediates for agrochem. fungicides, are prepared by reaction of compds. II with R2X2 (X2 = halo) in the presence of Lewis acids. Thus, acetylation of 2-ClC6H4CH2NHAc with AcCl in the presence of AlCl3 in CH2Cl2 gave 54.3% I (X1 = Cl, R1 = R2 = Ac) (III). Hydrolysis of III with H2SO4 followed by reaction with ClCO2Me gave N-(2-chloro-5-acetylbenzyl)carbamic acid Me ester.

II

AB The title compds. [I; R1 is (un)substituted aryl, aralkyl or a heterocyclic group; R2, R3, R4 are H or C1-3 alkyl; R5 is H, halo or C1-5 alkyl] are prepared by reductively aminating a cyclopentanone derivs. (II; R4-R5 = same as above). I are useful as agrochem. fungicides. Thus, II (R4 = H, R5 = tert-Bu) was reacted with N-methylbenzylamine in the presence of NaBH3CN to give cis- and trans-I (R1 = Ph, R2 = R4 = H, R3 = Me, R5 = tert-Bu) with yield of 55.0 and 28.5% resp., which showed 100% fungicidal activity for *Sphaerotheca fuliginea*.

AB Toluene derivs. I (R = F, Cl, alkoxy, alkylthio; X = halo) were prepared by reaction of 2-chloro-6-substituted-toluene derivs. II (R = same as above) with metallic magnesium in the presence of alkyl bromides in ethereal solvents. Toluene derivs. III were prepared by reaction of I with CO₂. Toluene derivs. IV (R₁ = alkyl) were prepared by reaction of 2,6-dichlorotoluene with metal alcoholates and alkylating agents. Thus, reaction of 2,6-dichlorotoluene with NaOMe/MeOH in DMSO at 150-155° for 3.5 h gave, after treatment with Me₂SO₄, 91.0% 2-chloro-6-methoxytoluene.

AB The migration behavior of palladium in UO2 was investigated by determining the concentration profiles of Pd in UO2 at temps. from 1573 to 2073 K in Ar+3% H2. Pd was found exclusively in the pores of UO2. The maximum penetration depth of Pd was more than 100 μ m for the pellet of 90% TD and about 50 μ m for the pellet of 95% TD for 100 h at 1623 K. Melted Pd wetted UO2 well and U was detected both in ppts. and in Pd sources, forming an α -Pd phase containing U at about 10 atomic%. On the basis of thermodyn. calcns., it was found that a UPd3 and Pd alloy containing U can form even under the oxygen potential, where O/U ratios were slightly higher than 2.00, say 2.000-2.003. From the above results, a model of the gaseous diffusion of Pd through pores in UO2 retarded by the formation of U-Pd alloy was proposed.

AB Pd is easily released from UO2 kernels in HTGR coated fuel particles and reacts with the SiC coating layer. In addition, Pd is 1 of the metallic fission products in irradiated UO2, which constitutes an insol. residue in reprocessing of LWR fuels. In the present investigation, the migration of Pd in UO2 was examined by heating diffusion pairs of sandwiched Pd foil between UO2 wafers at 1300-1800°. Expts. were also conducted on the affinity of Pd and the formation of U-Pd alloy. Pd was found mainly in the pores of UO2. The maximum depth intruded by Pd in fairly large amount was 100 µm for UO2 with 90% of theor. d. (TD) and 50 µm for UO2 with 95% TD, while the maximum length of open pores was 330 µm for UO2 with 90% TD, and 50 µm for that with 95% TD. Fused Pd wetted UO2 very much. Pd intruded deeply into UO2, especially in the edge of the Pd droplet. Furthermore, U was detected either in ppts. or the Pd source with α-Pd phase of U-Pd alloy containing Pd at .apprx.10at.%. This fact indicates that Pd highly reacts with UO2. From the above results, the transport of Pd in UO2 was explained by the model of gaseous diffusion through pores in UO2, which is retarded by formation of U-Pd

alloy. The UPd3 forms even at the 0 potential condition of a O/U ratio which is a little higher than 2.00 on the basis of thermodyn. calcn.

AB The title materials have a photosensitive layer containing an azo compound prepared from a mixture of a coupler and another coupler of the general formula I (R = organic moiety having ≥ 12 C atoms; Z = O, NH; A = group of atoms required to form a substituted or unsubstituted aromatic or heteroarom. ring). The azo compound exhibits high charge generation efficiency and high stability against light and heat, and the materials show improved sensitivity and durability. Thus, 3,3'-dichlorobenzidine was reacted with NaNO_2 to form a diazotized compound, which was then reacted with a coupler II and coupler III to obtain an azo compound. An Al substrate was coated with a charge-generating layer composed of the azo compound and U-100 (a polyarylate) and a charge-transport layer composed of 4-(N,N-dibenzylamino)-2-methylbenzaldehyde diphenylhydrazone to give an electrophotog. plate, which showed, by -6 kV corona charging and subsequent visible illumination, a surface potential of -740 V and a half-decay exposure of 2 lx-s initially and -770 V and 3 lx-s, resp., at the 100th run.

ED Entered STN: 12 May 1984

AB The title products, suitable as x-ray contrast agents, are prepared Thus, 265 g 3,5-diamino-2,4,6-triiodobenzoic acid, 400 g glutaric acid anhydride, and 18 ml H₂SO₄ were heated 17 hr to obtain 3,5-bis(glutarimido)-2,4,6-triiodobenzoic acid (I), m. >300° (containing 1 mole Me₂SO); Na salt m. 288-91° (water). I Na salt (89.10 g) was heated with 400 ml HCONMe₂ 20 min to 85° and 4 hr to 130-5° to give 76.93 g N,N'-(2,4,6-triiodo-m-phenylene)diglutari mide, m. >300° (AcOH). By similar methods were prepared 48 addnl. examples.
